

BIOFUEL POWERPLANT BOMHUS ENERGI IN GÄVLE NOW UP AND RUNNING

DISAB's complete turnkey vacuum system was ready for startup in August of 2012. Maria Carrendi, Operations Engineer at Bomhus Energi, says: *Already from the start of operation in August 2012 everything has run very well.*

Bomhus Energi was built to generate green energy economically and with high focus on a sound and safe working environment.

Our investment in a non-intrusive and robust cleaning system has proven itself both profitable and highly efficient.

It enables us to quickly and effortlessly carry out our daily cleaning routines keeping the entire plant free from wood chips and dust. A very important part of our safety policy, eliminating risks of system downtime and enabling a secure and reliable service to all our clients.

Our cleaning system consists of three DISAB-systems, two stationary and one mobile system.

We are particularly happy with DISAB's concept of incorporating a mobile system. This makes us free to instantly and with ease relocate the cleaning resources within the plant. This is a great benefit not least at our annual overhaul shut down when each hour saved equals instant substantial payback.

The system is highly flexible and is literally limitless. All connectors are strategically located facilitating access to all areas to be kept clean from dust and debris. The material is conveyed in a safe way through sealed piping to our three separate containers. If need be we can always further increase capacity by connecting a mobile vacuum unit.

Our cooperation with DISAB has been a great success and we have obtained a cleaning system fully meeting our high demands for efficiency as well as for safety.
